NAME

direntry – read directory entries

SYNTAX

#include <direntry.h>

DIR ***opendir**(*fn*);

struct direntry ***readdir**(*dir*);

void **closedir**(*dir*);

DIR **dir*;
char **fn*;

DESCRIPTION

The point of **direntry.h** is to provide a uniform interface to BSD's **sys/dir.h** and POSIX's **dirent.h**.

The **readdir** interface is highly unsatisfactory. It does not distinguish between I/O errors and end-of-directory. It uses **malloc**. The return type for **closedir** varies: some implementations return the **close** return value.

SEE ALSO
